Page 10

10.10 Problem 1} Which of the following sets of vectors are linearly independent?

a)  $\begin{bmatrix} 4 \\ -9 \\ 1 \end{bmatrix}, \begin{bmatrix} 2 \\ 13 \\ 10 \end{bmatrix}, \begin{bmatrix} 2 \\ -4 \\ 1 \end{bmatrix}$  in  $(\mathbb{R}^3, \mathbb{R})$

If the determinant of a matrix is zero, the columns of the matrix are linearly dependent. Calculating the determinant by cofactors:

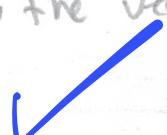

$$A = \begin{bmatrix} 4 & 2 & 2 \\ -9 & 13 & -4 \\ 1 & 10 & 1 \end{bmatrix}$$

$$\text{Det}(A) = (-1)^{1+1} (13 \cdot 1 - 10(-4)) + (-1)^{1+2} (-9 \cdot 1 - 1(-4))$$

$$= (-1)^{1+3} (-9(10) - (1)(13)) = 212 + 10 - 206 = 16$$

Due to  $\text{Det}(A) = 16$ , the vectors that forms A are linearly independent

b)  $\begin{bmatrix} 1+i \\ 2+3i \end{bmatrix}, \begin{bmatrix} 10+2i \\ 4-i \end{bmatrix}, \begin{bmatrix} -i \\ 3 \end{bmatrix}$  in  $(\mathbb{C}^2, \mathbb{R})$ .

linear independence: also parallel if to double the multiple

A set of vectors  $v_1, v_2, \dots, v_n \in \mathbb{C}^n$  are linearly independent if the unique solution to  $\alpha_1 v_1 + \alpha_2 v_2 + \dots + \alpha_n v_n = 0$  is the trivial one, where  $\alpha_1, \alpha_2, \dots, \alpha_n$  are 0 if these elements are scalars from the  $\mathbb{R}$  field.

$$\alpha_1 \begin{bmatrix} 1+i \\ 2+3i \end{bmatrix} + \alpha_2 \begin{bmatrix} 10+2i \\ 4-i \end{bmatrix} + \alpha_3 \begin{bmatrix} -i \\ 3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

①  $\alpha_1(1+i) + \alpha_2(10+2i) + \alpha_3(-i) = 0$

②  $\alpha_1(2+3i) + \alpha_2(4-i) + \alpha_3(3) = 0$

For reals in ① and ② For imaginary part in ① and ②

③  $\alpha_1 + 10\alpha_2 + 0\alpha_3 = 0$

⑤  $(\alpha_1 + 2\alpha_2 - \alpha_3)_i = 0$

④  $2\alpha_1 + 4\alpha_2 + 3\alpha_3 = 0$

⑥  $(3\alpha_1 - \alpha_2 + 0\alpha_3)_i = 0$

From ③

$$\alpha_1 = -10\alpha_2$$

From ⑥

$$\alpha_2 = 3\alpha_1$$

Then

$$\alpha_1 = -10(3\alpha_1) \rightarrow \alpha_1 + 30\alpha_1 = 0 \rightarrow 31\alpha_1 = 0 \rightarrow \boxed{\alpha_1 = 0}$$

④  $0 + 10\alpha_2 + 0\alpha_3 = 0 \rightarrow \boxed{\alpha_2 = 0}$  Hence  $\boxed{\alpha_3 = 0}$

The set is linearly independent  $(\mathbb{C}^2, \mathbb{R})$

Page 2.

9)  $\bar{e}^t, t\bar{e}^t, \bar{e}^{-t}$  in  $(\mathcal{W}, \mathbb{R})$  as  $\alpha_1, \alpha_2, \alpha_3 \in \mathbb{R}$  (b)

set of all piecewise continuous functions defined on  $[0, \infty)$

$$\textcircled{1} \quad \alpha_1 \bar{e}^t + \alpha_2 t \bar{e}^t + \alpha_3 \bar{e}^{-t} = 0 \quad \forall \alpha_1, \alpha_2, \alpha_3 \in \mathbb{R}.$$

$$\textcircled{2} \quad \bar{e}^t (\alpha_1 + \alpha_2 t + \alpha_3 \bar{e}^{-t}) = 0$$

$$\textcircled{3} \quad \alpha_1 + \alpha_2 t + \alpha_3 \bar{e}^{-t} = 0 \quad \text{Setting } t=0.$$

$$\alpha_1 + \alpha_2(0) + \alpha_3(1) = 0 \rightarrow \alpha_1 = -\alpha_3 \quad \textcircled{4}$$

$t=1$

$$\alpha_1 + \alpha_2 + \alpha_3 \bar{e}^1 = 0 \quad \textcircled{5}$$

$t=2$

$$\alpha_1 + 2\alpha_2 + \alpha_3 \bar{e}^2 = 0 \quad \textcircled{6}$$

with  $\textcircled{4}$  and  $\textcircled{5}$

$$-\alpha_3 + \alpha_2 + \alpha_3 \bar{e}^1 = 0 \rightarrow \alpha_3(\bar{e}^1 - 1) + \alpha_2 = 0$$

$$\alpha_2 = -\alpha_3(\bar{e}^1 - 1) \quad \textcircled{7}$$

with  $\textcircled{7}$  and  $\textcircled{6}$  and  $\textcircled{4}$

$$-\alpha_3 + 2(-\alpha_3(\bar{e}^1 - 1)) + \alpha_3 \bar{e}^2 = 0$$

$$-\alpha_3 - 2\alpha_3(\bar{e}^1 - 1) + \alpha_3 \bar{e}^2 = 0$$

$\alpha_3(\bar{e}^2 - 2(\bar{e}^1 - 1) - 1) = 0$  The only way to make this equation 0 is that  $\alpha_3 = 0$ . Then  $\alpha_1 = -\alpha_3$ ,  $\alpha_2 = 0$  so  $\alpha_2 = 0$  so the set is linearly independent.. ✓

d)  $3s^2 + s - 10, -2s + 3, s - 5$  in  $(\mathbb{R}_3[s], \mathbb{R})$  ni  $\mathcal{S}, \mathcal{S} + \mathcal{T}, \mathcal{T}$

equation showing the 3s to be

$$\alpha_1(3s^2 + s - 10) + \alpha_2(-2s + 3) + \alpha_3(s - 5) = 0 \quad \checkmark$$

$$s^2(3\alpha_1) + s^1(\alpha_1 - 2\alpha_2 + \alpha_3) + s^0(-10\alpha_1 + 3\alpha_2 - 5\alpha_3) = 0$$

$$\textcircled{1} \quad 3\alpha_1 = 0 \rightarrow \boxed{\alpha_1 = 0}$$

$$\textcircled{2} \quad \alpha_1 - 2\alpha_2 + \alpha_3 = 0 \rightarrow \textcircled{4} \quad \underline{\alpha_3 = 2\alpha_2}$$

$$\textcircled{3} \quad -10\alpha_1 + 3\alpha_2 - 5\alpha_3 = 0$$

Using  $\textcircled{4}$  and  $\textcircled{3}$

$$\cancel{-10\alpha_1} + 3\alpha_2 - 5(2\alpha_2) = 0$$

$$3\alpha_2 - 10\alpha_2 = 0$$

$$-7\alpha_2 = 0 \rightarrow \boxed{\alpha_2 = 0} \quad \checkmark$$

Using  $\textcircled{2}$

$$\cancel{\alpha_1} - \cancel{2\alpha_2} + \alpha_3 = 0 \rightarrow \boxed{\alpha_3 = 0}$$

$\alpha_1, \alpha_2, \alpha_3 = 0$  Thus the set is linearly independent.  $\checkmark$

$$e) \frac{3s^2-12}{2s^3+4s-1}, \frac{4s^5+s^3-2s-1}{1}, \frac{1}{s^2+s+1} \text{ in } (\mathbb{R}(s), \mathbb{R})$$

Linear Combination:

$$\forall \alpha_1, \alpha_2, \alpha_3 \in \mathbb{R} \quad \alpha_1 V_1 + \alpha_2 V_2 + \alpha_3 V_3 = 0$$

$$\alpha_1 \left( \frac{3s^2-12}{2s^3+4s-1} \right) + \alpha_2 \left( \frac{4s^5+s^3-2s-1}{1} \right) + \alpha_3 \left( \frac{1}{s^2+s+1} \right) = 0$$

Common denominator  $(2s^3+4s-1), (s^2+s+1)$

$$\alpha_1 \left( \frac{(3s^2-12)(s^2+s+1)}{(2s^3+4s-1)(s^2+s+1)} \right) + \alpha_2 \left( \frac{(4s^5+s^3-2s-1)(s^2+s+1)(2s^3+4s-1)}{(s^2+s+1)(2s^3+4s-1)} \right)$$

$$+ \alpha_3 \left( \frac{(1)(2s^3+4s-1)}{(s^2+s+1)(2s^3+4s-1)} \right) = 0 \quad \text{Since the denominator is non zero the numerator must be zero.}$$

$$\alpha_1 (3s^2-12)(s^2+s+1) + \alpha_2 (4s^5+s^3-2s-1)(s^2+s+1)(2s^3+4s-1)$$

$$+ \alpha_3 (2s^3+4s-1) = 0$$

$$s^{10}(8\alpha_2) + s^9(8\alpha_2) + s^8(26\alpha_2) + s^7(14\alpha_2) + s^6(14\alpha_2) - s^5(7\alpha_2)$$

$$+ s^4(3\alpha_1 - 11\alpha_2) + s^3(3\alpha_1 - 13\alpha_2 + 2\alpha_3) - 9s^2(\alpha_1 + \alpha_2)$$

$$+ s(-12\alpha_1 - \alpha_2 + 4\alpha_3) + (-12\alpha_1 + \alpha_2 - \alpha_3) = 0 \quad ①$$

From equation ① we have:  $s^4(8\alpha_2)$ , so the only way to make this term 0 is  $8\alpha_2 = 0 \rightarrow \boxed{\alpha_2 = 0}$

Now with  $s^4(3\alpha_1 - 11\alpha_2) \rightarrow 3\alpha_1 - 11\alpha_2 = 0$

$$3\alpha_1 - 11(0) = 0 \rightarrow 3\alpha_1 = 0 \rightarrow \boxed{\alpha_1 = 0}.$$

The term  $s(-12\alpha_1 - \alpha_2 + 4\alpha_3)$  must be zero.

$$-12(0) - (0) + 4\alpha_3 = 0 \rightarrow 4\alpha_3 = 0 \rightarrow \boxed{\alpha_3 = 0}$$

Hence the set e) is linearly independent

Problem 1b in  $(\mathbb{C}^2, \mathbb{C})$  5<sup>th</sup>

From page 2 eq ①  $x_1, x_2, x_3 \in \mathbb{C}$

$$(x_1 + y_1 i)(1+i) + (x_2 + y_2 i)(10+2i) + (x_3 + y_3 i)(-i) = 0$$

$$(x_1 + x_1 i + y_1 i - y_1) + (10x_2 + 2x_2 i + 10y_2 i - 2y_2) +$$

$$(x_3 i + y_3) = 0 \quad \text{Grouping Re and Im}$$

$$\textcircled{1} (x_1 - y_1 + 10x_2 - 2y_2 + y_3) + \textcircled{2} (x_1 + y_1 + 2x_2 + 10y_2 - x_3) = 0$$

eq ② page 2.

$$(x_1 + y_1 i)(2+3i) + (x_2 + y_2 i)(4-i) + x_3 + y_3 i (3) = 0$$

$$(2x_1 + 3x_1 i + 2y_1 i - 3y_1) + (4x_2 - x_2 i + 4y_2 i + y_2) +$$

$$(3x_3 + 3y_3 i) = 0 \quad \text{Grouping}$$

$$\textcircled{3} (2x_1 - 3y_1 + 4x_2 + y_2 + 3x_3) + i(3x_1 + 2y_1 - x_2 + 4y_2 + 3y_3) = 0$$

We can keep operating until we find if the system of equations formed by ①, ②, ③, ④ has other solutions.

But lets consider the following, eq ① page 2-

Net page

Eq ① page 2.

(0, 0) is a solution

$$\alpha_1(1+i) + \alpha_2(1+2i) + \alpha_3(-i) = 0$$

$$\text{let } \alpha_1 = (0+i), \alpha_2 = 0 \text{ and } \alpha_3 = (1+i)$$

$$(0+i)(1+i) + 0 + (1+i)(-i) = 0$$

$$[(0)(1) + (0)(i) + i(1) + (i)(i)] + 0 + [(-i)(1) + (i)(-i)] = 0$$

$$(0+0+i-1) + 0 + (-i - i^2) = 0$$

$$(i-1) - (i + (-1)) = 0$$

$$(i-1) + (1-i) = 0 \rightarrow i - i + 1 - i = 0$$

$10=0$  When  $\alpha_1 = (0+i)$ ,  $\alpha_2 = 0$  and  $\alpha_3 = (1+i)$

the equation gives 0 so there is other solution  
then the trivial one. The set is linearly dependent in  $(C, C)$  ✓

Problem 1d in  $(\mathbb{R}(s), \mathbb{R}(s))$  ( $\alpha_1, \alpha_2, \alpha_3 \in \mathbb{R}(s)$ )  $\left| \frac{P(s)}{Q(s)} \right|^3$

From Page 4 problem 1d but now with  $\mathbb{R}(s)$ .

$$\underbrace{s^2(3\alpha_1)}_1 + \underbrace{s^1(\alpha_1 - 2\alpha_2 + \alpha_3)}_1 + \underbrace{s^0(-10\alpha_1 + 3\alpha_2 - 5\alpha_3)}_1 = 0$$

$$3s^2 \left( \frac{P_1(s)}{Q_1(s)} \right) = 0 \quad \text{for all } s \neq 0 \Rightarrow \frac{P_1(s)}{Q_1(s)} = 0 \rightarrow \boxed{\alpha_1 = 0}$$

$$s^1 \left( 0 - 2 \left( \frac{P_2(s)}{Q_2(s)} \right) + \frac{P_3(s)}{Q_3(s)} \right) = 0 \quad \text{Suppose } s=1$$

$$+ \frac{2P_2(s)}{Q_2(s)} = + \frac{P_3(s)}{Q_3(s)} = \alpha_3 = 2\alpha_2$$

Using  $s^0$  term

$$-10(0) + 3\alpha_2 - 5(2\alpha_2) = 0 \rightarrow -7\alpha_2 = 0$$

$$\frac{-7P_2(s)}{Q_2(s)} = 0, \alpha_2 \text{ must be } 0 \rightarrow \boxed{\alpha_2 = 0}$$

$\alpha_3 = 2(0) \rightarrow \boxed{\alpha_3 = 0}$  The set is still linearly independent in  $(\mathbb{R}(s), \mathbb{R}(s))$

$$\alpha_1(3s^2 + s - 10) + \alpha_2(-2s + 3) + \alpha_3(s - 5) = 0$$

$\alpha_i \in \mathbb{R}[s]$  función racional.

Una posible solución;  $\alpha_1(s) = 0, \alpha_2 = \frac{-1}{-2s+3} \text{ y } \alpha_3 = \frac{1}{s-5}$

Problem 1e in  $(\mathbb{R}(s), \mathbb{R}(s))$  ( $\alpha_1, \alpha_2, \alpha_3 \in \mathbb{R}(s)$ ) |  $\frac{P(s)}{Q(s)}$

From page 5:

$$Q(s) \neq 0$$

$$\frac{P_1(s)}{Q_1(s)} \left( \frac{3s^2-12}{2s^3+4s-1} \right) + \frac{P_2(s)}{Q_2(s)} \left( \frac{4s^5+s^3-2s-1}{1} \right) + \frac{P_3(s)}{Q_3(s)} \left( \frac{1}{s^2+5s+1} \right) = 0$$

There is not such a function of the form  $\frac{P(s)}{Q(s)}$

that multiplied by other function  $\frac{Z(s)}{R(s)}$  gives us 0  
only  $\frac{O(s)}{Q(s)}$ .

Example:

$$\frac{P_1(s)(3s^2-12)}{Q_1(s)(2s^3+4s-1)} = 0$$

$$P_1(s)(3s^2-12) = (0)[Q_1(s)(2s^3+4s-1)]$$

$$P_1(s)(3s^2-12) = 0$$

$$P_1(s) = \frac{0}{3s^2-12}$$

$\boxed{P_1(s) = 0}$  The same demonstration applies for the other terms.

It's still linearly independent in  $(\mathbb{R}(s), \mathbb{R}(s))$

Revisar la solución anterior-

### Problem 3

10/10

Exercise 3.12 Is the vector  $v = (3, -1, 0, -1)$  in the subspace of  $\mathbb{R}^4$  spanned by the vectors  $(2, -1, 3, 2)$ ,  $(-1, 1, 1, -3)$ ,  $(1, 1, 9, -5)$ ?

We need to prove that a linear combination of the basis vectors gives us the vector  $v$ .

$$\alpha_1(2, -1, 3, 2) + \alpha_2(-1, 1, 1, -3) + \alpha_3(1, 1, 9, -5) = (3, -1, 0, -1)$$

$$\textcircled{1} \quad (2\alpha_1 - \alpha_2 + \alpha_3) = 3 \quad \textcircled{3} \quad (3\alpha_1 + \alpha_2 + 9\alpha_3) = 0$$

$$\textcircled{2} \quad (-\alpha_1 + \alpha_2 + \alpha_3) = -1 \quad \textcircled{4} \quad (2\alpha_1 - 3\alpha_2 - 5\alpha_3) = -1$$

$$\begin{bmatrix} 4 \times 3 & & 3 \times 1 \\ \left[ \begin{array}{ccc|c} 2 & -1 & 1 \\ -1 & 1 & 1 \\ 3 & 1 & 9 \\ 2 & -3 & -5 \end{array} \right] & \left[ \begin{array}{c} \alpha_1 \\ \alpha_2 \\ \alpha_3 \end{array} \right] & = & \begin{bmatrix} 4 \times 1 \\ \left[ \begin{array}{c} 3 \\ -1 \\ 0 \\ -1 \end{array} \right] \end{bmatrix} \end{bmatrix}$$

Constructing Augmented Matrix

$$\left[ \begin{array}{cccc|c} 2 & -1 & 1 & 1 & 3 \\ -1 & 1 & 1 & -1 & -1 \\ 3 & 1 & 9 & 0 & 0 \\ 2 & -3 & -5 & 1 & -1 \end{array} \right] \begin{array}{l} R_1(\frac{1}{2}) + R_2 \\ R_1(-\frac{3}{2}) + R_3 \\ R_1(-1) + R_4 \end{array} \left[ \begin{array}{cccc|c} 2 & -1 & 1 & 1 & 3 \\ 0 & \frac{1}{2} & \frac{1}{2} & 1 & \frac{1}{2} \\ 0 & \frac{5}{2} & \frac{15}{2} & -\frac{9}{2} & -4 \\ 0 & -2 & -6 & 1 & -4 \end{array} \right] R_2(2)$$

$$\left[ \begin{array}{cccc} 2 & -1 & 1 & | & 3 \\ 0 & 1 & 1 & | & 1 \\ 0 & \frac{5}{2} & \frac{15}{2} & | & -\frac{1}{2} \\ 0 & -2 & -6 & | & -4 \end{array} \right] R_2 + R_1$$

Einfördert

$$\left[ \begin{array}{cccc} 2 & -1 & 1 & | & 3 \\ 0 & 1 & 1 & | & 1 \\ 0 & \frac{5}{2} & \frac{15}{2} & | & -\frac{1}{2} \\ 0 & -2 & -6 & | & -4 \end{array} \right] \xrightarrow{\text{R}_2 \left( -\frac{5}{2} \right) + R_3} \left[ \begin{array}{cccc} 2 & -1 & 1 & | & 3 \\ 0 & 1 & 1 & | & 1 \\ 0 & 0 & 0 & | & -\frac{13}{2} \\ 0 & -2 & -6 & | & -4 \end{array} \right] \xrightarrow{\text{R}_2 \left( 2 \right) + R_4}$$

$$\therefore (2, -1, 1, 1), (2, -1, 1, 1)$$

$$\left[ \begin{array}{cccc} 2 & 0 & 2 & | & 4 \\ 0 & 1 & 1 & | & 1 \\ 0 & 0 & 5 & | & -7 \\ 0 & 0 & -4 & | & -2 \end{array} \right] R_3 \left( \frac{1}{5} \right)$$

$$\left[ \begin{array}{cccc} 2 & 0 & 2 & | & 4 \\ 0 & 1 & 1 & | & 1 \\ 0 & 0 & 1 & | & -\frac{7}{5} \\ 0 & 0 & -4 & | & -2 \end{array} \right] R_3(4) + R_4$$

$$\left[ \begin{array}{cccc} 2 & 0 & 2 & | & 4 \\ 0 & 1 & 1 & | & 1 \\ 0 & 0 & 1 & | & -\frac{7}{5} \\ 0 & 0 & 0 & | & -\frac{38}{5} \end{array} \right] \text{From row 4: } 0 = \underline{-\frac{38}{5}}$$

$$2x_1 + 2x_3 = 4$$

$$x_2 + x_3 = 1$$

$$x_3 = -\frac{7}{5}$$

$$0 = -\frac{38}{5} \quad \text{There is no solution} \checkmark$$

the vector  $u$  isn't in  
the subspace of  $\mathbb{R}^4$   
spanned by the set of vectors.

Exercise 3.14 . Show that:  $(1-t)^3, (1-t)^2, (1-t), 1$   
 spans the  $\mathbb{R}^3[t]$  space

$$\dim(P_3(\mathbb{R})) = 4 \quad : P(t) = a_0 + a_1 t + a_2 t^2 + a_3 t^3.$$

$$a_0 + a_1 t + a_2 t^2 + a_3 t^3 = \alpha_1(1) + \alpha_2(1-t) + \alpha_3(1-t)^2 + \alpha_4(1-t)^3$$

Expanding the polynomial.

$$\alpha_1 + (\alpha_2 - \alpha_2 t) + (\alpha_3 - 2\alpha_3 t + \alpha_3 t^2) + (\alpha_4 - 3\alpha_4 t + 3\alpha_4 t^2 - \alpha_4 t^3)$$

Grouping

$$(\alpha_1 + \alpha_2 + \alpha_3 + \alpha_4) = a_0$$

$$t(-\alpha_2 - 2\alpha_3 - 3\alpha_4) \rightarrow (-\alpha_2 - 2\alpha_3 - 3\alpha_4) = a_1$$

$$t^2(\alpha_3 + 3\alpha_4) \rightarrow (\alpha_3 + 3\alpha_4) = a_2$$

$$t^3(-\alpha_4) \rightarrow -\alpha_4 = a_3$$

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 0 & -1 & -2 & -3 \\ 0 & 0 & 1 & 3 \\ 0 & 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} \alpha_1 \\ \alpha_2 \\ \alpha_3 \\ \alpha_4 \end{bmatrix} = \begin{bmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{bmatrix}$$

$$\vec{\alpha} = A^{-1} \vec{a}$$

Since it's a square matrix  
 we can calculate its inverse  
 to find  $\alpha_1, \alpha_2, \alpha_3, \alpha_4$ . ✓

The inverse of  $A$  is the same matrix  $A = A^{-1}$

$$\begin{bmatrix} \alpha_1 \\ \alpha_2 \\ \alpha_3 \\ \alpha_4 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 0 & -1 & -2 & -3 \\ 0 & 0 & 1 & 3 \\ 0 & 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{bmatrix} \quad \begin{aligned} \alpha_1 &= a_0 + a_1 + a_3 \\ \alpha_2 &= -a_1 - 2a_2 - 3a_3 \\ \alpha_3 &= a_2 + 3a_3 \\ \alpha_4 &= -a_3 \end{aligned}$$

With the values of  $\alpha_1, \alpha_2, \alpha_3, \alpha_4$  we can work out the range of  $(\mathbb{R}^3[t])^\perp$ .

$$\alpha_1 + \alpha_2 + \alpha_3 + \alpha_4 = 0$$

$$(\alpha_0 + \alpha_1 t + \alpha_2 t^2 + \alpha_3 t^3) + (-\alpha_1 - 2\alpha_2 - 3\alpha_3) + (\alpha_2 + 3\alpha_3) + (-\alpha_3) = \alpha_0$$

$$\alpha_0 + \alpha_1(1-t) + \alpha_2(1-t^2+t) + \alpha_3(1-3t^3+t^2-t) = \alpha_0$$

$\boxed{1\alpha_0 = \alpha_0}$ . The same applies for the other constants.

$$\alpha_1(1) + \alpha_2(1-t) + \alpha_3(1-t^2) + \alpha_4(1-t^3) = \alpha_0 + \alpha_1 t + \alpha_2 t^2 + \alpha_3 t^3$$

We conclude that the set spans the entire  $\mathbb{R}^3[t]$  space because the linear combination of the vectors gives us an  $\mathbb{R}^3[t]$  polynomial. ✓

We can see that  $(1-t)^3$  can be ignored since we went to span  $\mathbb{R}^3[t]$  not  $\mathbb{R}^4[t]$ .

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & -1 & 1 & -1 \\ 1 & 1 & -3 & 1 \end{bmatrix} \begin{bmatrix} \alpha_0 \\ \alpha_1 \\ \alpha_2 \\ \alpha_3 \end{bmatrix} = \begin{bmatrix} \alpha_0 \\ 0 \\ 0 \end{bmatrix}$$

From the first row,  $\alpha_0 = 0$ .  
From the second row,  $\alpha_1 = 0$ .  
From the third row,  $\alpha_2 = 0$ .  
From the fourth row,  $\alpha_3 = 0$ .

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & -1 & 1 & -1 \\ 1 & 1 & -3 & 1 \\ 1 & 1 & 1 & -1 \end{bmatrix} \begin{bmatrix} \alpha_0 \\ \alpha_1 \\ \alpha_2 \\ \alpha_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

so  $\alpha_0 = \alpha_1 = \alpha_2 = \alpha_3 = 0$

Exercise 3.15 To solve what's left of  $\text{Ex} 3.14$  and 2P exercise

Find a vector in  $\mathbb{R}^3$  which spans the intersection of  $U$  and  $W$   
where  $U$  is the plane  $xy$ :  $U = \{(a, b, 0) | a, b \in \mathbb{R}\}$  and the plane  
 $W$  is the space spanned by the vectors  $(0, 2, 3)$  and  $(1, -1, 1)$ .

To find a vector in  $W$  we do a linear combination

$$\alpha_1(1, 2, 3) + \alpha_2(1, -1, 1)$$

$$(\alpha_1 + \alpha_2, 2\alpha_1 - \alpha_2, 3\alpha_1 + \alpha_2) =$$

The form of the elements in  $U$  is  $(x, y, 0)$  so  
the third element is always 0.

$$(\alpha_1 + \alpha_2, 2\alpha_1 - \alpha_2, 3\alpha_1 + \alpha_2) = (x, y, 0)$$

$$x = \alpha_1 + \alpha_2 ; y = 2\alpha_1 - \alpha_2 ; 0 = 3\alpha_1 + \alpha_2$$

$$0 = \alpha_1 + (-3\alpha_1) \quad y = 2\alpha_1 - (3\alpha_1) \quad \alpha_2 = -3\alpha_1$$

$$x = -2\alpha_1 \quad y = 5\alpha_1 \quad \alpha_2 = -\frac{3y}{5}$$

$$\alpha_1 = \frac{-x}{2} \quad \alpha_1 = \frac{y}{5}$$

$$\frac{-x}{2} = \frac{y}{5} \rightarrow -x = \frac{2y}{5} \rightarrow x = \underline{\underline{\frac{-2y}{5}}}$$

The vector that intersects  $U$  and  $W$  is:

$$\underline{\underline{(-\frac{2y}{5}, y, 0)}}$$

**Q10** Exercise 4.5 Let  $V = \mathbb{R}^3[t]$  in the vector space of polynomials with grade  $\leq 3$  over  $\mathbb{R}$ . Determine whether  $u, v, w \in V$  are linearly independent or dependent (0 if i)  $f=0$  if only not at 0 and

$$u = t^3 - 4t^2 + 2t + 3, \quad v = t^3 + 2t^2 + 4t - 1, \quad w = 2t^3 - t^2 - 3t + 5$$

$$\alpha_1(t^3 - 4t^2 + 2t + 3) + \alpha_2(t^3 + 2t^2 + 4t - 1) + \alpha_3(2t^3 - t^2 - 3t + 5) = 0$$

$$t^3(\alpha_1 + \alpha_2 + 2\alpha_3) = 0$$

$$t^2(-4\alpha_1 + 2\alpha_2 - \alpha_3) = 0$$

$$t(2\alpha_1 + 4\alpha_2 - 3\alpha_3) = 0$$

$$(3\alpha_1 - \alpha_2 + 5\alpha_3) = 0$$

$$\begin{matrix} 4 \times 3 & 3 \times 1 & 4 \times 1 \\ \left[ \begin{array}{ccc} 1 & 1 & 2 \\ -4 & 2 & -1 \\ 2 & 4 & -3 \\ 3 & -1 & 5 \end{array} \right] & \left[ \begin{array}{c} \alpha_1 \\ \alpha_2 \\ \alpha_3 \end{array} \right] & = \left[ \begin{array}{c} 0 \\ 0 \\ 0 \\ 0 \end{array} \right] \end{matrix}$$

$$\left[ \begin{array}{ccc|c} 1 & 1 & 2 & 0 \\ -4 & 2 & -1 & 0 \\ 2 & 4 & -3 & 0 \\ 3 & -1 & 5 & 0 \end{array} \right] \xrightarrow{R_1(4)+R_2} \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 0 \\ 0 & 6 & 7 & 0 \\ 0 & 2 & 1 & 0 \\ 0 & -4 & -1 & 0 \end{array} \right] \xrightarrow{R_2(-1)+R_1} \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 0 \\ 0 & 6 & 7 & 0 \\ 0 & 2 & 1 & 0 \\ 0 & -4 & -1 & 0 \end{array} \right] \xrightarrow{R_2(\frac{1}{6})} \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 0 \\ 0 & 1 & \frac{7}{6} & 0 \\ 0 & 2 & 1 & 0 \\ 0 & -4 & -1 & 0 \end{array} \right] \xrightarrow{R_2(-2)+R_3} \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 0 \\ 0 & 1 & \frac{7}{6} & 0 \\ 0 & 0 & -1 & 0 \\ 0 & -4 & -1 & 0 \end{array} \right] \xrightarrow{R_2(4)+R_4} \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 0 \\ 0 & 1 & \frac{7}{6} & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right]$$

$$\left[ \begin{array}{ccc|c} 1 & 0 & \frac{5}{6} & 0 \\ 0 & 1 & \frac{7}{6} & 0 \\ 0 & 0 & -\frac{4}{3} & 0 \\ 0 & 0 & \frac{11}{3} & 0 \end{array} \right] \xrightarrow{R_3(-\frac{5}{6})+R_1} \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] \xrightarrow{\alpha_1=0} \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] \xrightarrow{\alpha_2=0} \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] \xrightarrow{\alpha_3=0} \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] \xrightarrow{o=0} o=0$$

The vectors  $u, v$  and  $w$  are linearly independent

$\Rightarrow (0, 1, -\frac{4}{3}) \in$

**Ex 5.21** Determine whether the set  $S = \{1, 1-t, (1-t)^2, (1-t)^3\}$  is a basis for the vector space of polynomial of grade  $\leq 3$ .  $\mathbb{R}[t]$

In page 13! Exercise 3.34 we did show that the set vectors spans  $\mathbb{R}^3[t]$ , so now we need to prove linear independence because these vectors to be a basis needs to be linearly independent and also span the whole  $\mathbb{R}^4[t]$ .

From the system of equations in page 13.

$$(\alpha_1 + \alpha_2 + \alpha_3 + \alpha_4) = 0 \rightarrow \alpha_1 = 0$$

$$(-\alpha_2 - 2\alpha_3 - 3\alpha_4) = 0 \rightarrow -\alpha_2 = 0 \rightarrow \alpha_2 = 0$$

$$(\alpha_3 + 3\alpha_4) = 0 \quad \alpha_3 = 0$$

$(-\alpha_4) = 0 \rightarrow \alpha_4 = 0$  The set of vectors are linearly independent.

Although we did show that  $\mathbb{R}^3[t]$  is spanned by the set of vectors in Page 13 we did the problem considering  $\mathbb{R}^4[t]$ :

$$\mathbb{R}^3[t] = a_0 + a_1 t + a_2 t^2; \mathbb{R}^4[t] = a_0 + a_1 t + a_2 t^2 + a_3 t^3$$

In page 13 we got  $\alpha_1, \alpha_2, \alpha_3, \alpha_4$  values which generates a polynomial grade  $\leq 3$  with that set of vectors. Hence the set is a basis

Problem 4 | Exercise 6.4

Find the solution of an homogeneous system generated by:

$$\{(1, -2, 0, 3, -1), (2, -3, 2, 5, -3), (1, -2, 1, 2, -2)\}$$

$Ax = b \rightarrow Ax = 0$  solution set to  
find

$$\begin{bmatrix} 1 & -2 & 0 & 3 & -1 \\ 2 & -3 & 2 & 5 & -3 \\ 1 & -2 & 1 & 2 & -2 \end{bmatrix} \begin{bmatrix} a \\ b \\ c \\ d \\ e \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Row one times  $-2$  plus Row 2.

Row one times  $-1$  plus Row 3.

$$\begin{bmatrix} 1 & -2 & 0 & 3 & -1 & 0 \\ 0 & 1 & 2 & -1 & -1 & 0 \\ 0 & 0 & 1 & -1 & -1 & 0 \end{bmatrix} \quad \begin{array}{l} a - 2b + 0c + 3d - e = 0 \\ b + 2c - d - e = 0 \\ c - d - e = 0 \rightarrow c = d + e \end{array}$$

$$b + 2(d+e) - d - e = 0 \rightarrow b = -2(d+e) + d + e$$

$$b = -2d - 2e + d + e = \boxed{-d - e} = -5d - e$$

$$a - 2(-d - e) + 3d - e = 0 \rightarrow a + 2d + 2e + 3d - e = 0$$

$$a + 5d + e = 0 \rightarrow \boxed{a = -5d - e} \quad \boxed{d = d} \quad \boxed{e = e}$$

$$\left\{ \begin{bmatrix} -5d - e \\ -d - e \\ d + e \\ d \\ e \end{bmatrix} \right\}$$

$$\rightarrow = d \begin{bmatrix} -5 \\ -1 \\ 1 \\ 1 \\ 0 \end{bmatrix} + e \begin{bmatrix} -1 \\ -1 \\ 1 \\ 0 \\ 1 \end{bmatrix}$$
